

Friday 12 June 2015 – Afternoon

**GCSE TWENTY FIRST CENTURY SCIENCE
PHYSICS A/ADDITIONAL SCIENCE A**

A182/02 Modules P4 P5 P6 (Higher Tier)

Candidates answer on the Question Paper.
A calculator may be used for this paper.

OCR supplied materials:
None

Other materials required:

- Pencil
- Ruler (cm/mm)

Duration: 1 hour

Candidate forename		Candidate surname	
-----------------------	--	----------------------	--

Centre number						Candidate number				
---------------	--	--	--	--	--	------------------	--	--	--	--

INSTRUCTIONS TO CANDIDATES

- Write your name, centre number and candidate number in the boxes above. Please write clearly and in capital letters.
- Use black ink. HB pencil may be used for graphs and diagrams only.
- Answer **all** the questions.
- Read each question carefully. Make sure you know what you have to do before starting your answer.
- Write your answer to each question in the space provided. Additional paper may be used if necessary but you must clearly show your candidate number, centre number and question number(s).
- Do **not** write in the bar codes.

INFORMATION FOR CANDIDATES

- The quality of written communication is assessed in questions marked with a pencil (✎).
- A list of useful relationships is printed on page 2.
- The number of marks is given in brackets [] at the end of each question or part question.
- The total number of marks for this paper is **60**.
- This document consists of **20** pages. Any blank pages are indicated.

TWENTY FIRST CENTURY SCIENCE EQUATIONS

Useful relationships

The Earth in the Universe

$$\text{distance} = \text{wave speed} \times \text{time}$$

$$\text{wave speed} = \text{frequency} \times \text{wavelength}$$

Sustainable energy

$$\text{energy transferred} = \text{power} \times \text{time}$$

$$\text{power} = \text{voltage} \times \text{current}$$

$$\text{efficiency} = \frac{\text{energy usefully transferred}}{\text{total energy supplied}} \times 100\%$$

Explaining motion

$$\text{speed} = \frac{\text{distance travelled}}{\text{time taken}}$$

$$\text{acceleration} = \frac{\text{change in velocity}}{\text{time taken}}$$

$$\text{momentum} = \text{mass} \times \text{velocity}$$

$$\text{change of momentum} = \text{resultant force} \times \text{time for which it acts}$$

$$\text{work done by a force} = \text{force} \times \text{distance moved in the direction of the force}$$

$$\text{amount of energy transferred} = \text{work done}$$

$$\text{change in gravitational potential energy} = \text{weight} \times \text{vertical height difference}$$

$$\text{kinetic energy} = \frac{1}{2} \times \text{mass} \times [\text{velocity}]^2$$

Electric circuits

$$\text{power} = \text{voltage} \times \text{current}$$

$$\text{resistance} = \frac{\text{voltage}}{\text{current}}$$

$$\frac{\text{voltage across primary coil}}{\text{voltage across secondary coil}} = \frac{\text{number of turns in primary coil}}{\text{number of turns in secondary coil}}$$

Radioactive materials

$$\text{energy} = \text{mass} \times [\text{speed of light in a vacuum}]^2$$

Answer **all** the questions

1 Iggy the cat is sitting next to the bottom of a wall.

He jumps from the ground onto the wall.
The wall is 1.5m high and Iggy gains 66J of gravitational potential energy.

(a) What is Iggy's weight?

Put a ring around the correct answer.

- 4.4 N**
9.9 N
44 N
99 N
[1]

(b) As Iggy walks along the wall he knocks a tin can off the wall and it falls to the ground.

The tin can weighs 0.2kg and its velocity just before hitting the ground is 5.1 m/s.

(i) Calculate the momentum of the tin can just before it hits the ground.

momentum kgm/s **[1]**

(ii) When the tin can hits the ground it takes 0.1s to stop moving.

Calculate the resultant force acting on the can.

resultant force N **[2]**

(iii) The tin can took 0.1s to stop moving because the ground was **soft**.

Explain what effect **hard** ground would have had on the resultant force.

.....

.....

..... **[2]**

(c) George and Kate do an experiment with falling objects.

They use two balls of the same shape and size, but **different masses**. They release the balls from the same height and find that they take the same time to drop to the floor.

George
Because the balls take the same time to drop, this shows that they have the **same speed** and **kinetic energy** as each other just before hitting the floor.

Kate
But the mass of the ball affects its speed and kinetic energy, so both would be **different**.

Comment on their conclusions.
Use equations to justify your answer.

Turn over for the next question

2 Alex goes for a ride on his bike.

The graph shows how his displacement from the start of his ride changes with time.

The graph has been divided into five regions, **A**, **B**, **C**, **D** and **E**.

(a) Which region or regions show each type of motion?

Put ticks (✓) in the correct box or boxes for each row.

You may tick more than one box in a row.

Type of motion	Region				
	A	B	C	D	E
Stationary					
Moving with constant speed					
Fastest instantaneous speed					

[2]

(b) Which of the following sketch graphs shows Alex's velocity in regions C, D and E?

Put a **ring** around the correct graph.

[1]

(c) On the sketch graph below show how Alex's **velocity** changes with time in region A.

[2]

[Total: 5]

4 Anna is investigating resistors.

- (a) She connects a resistor to a battery, an ammeter and a voltmeter to measure the resistance of the resistor.

Complete the circuit that she should use.

[2]

- (b) The current she measures through the resistor, R, in part (a) is **0.2 A**.

She then makes changes to her circuit using the same battery and resistor as in part (a).

The following circuits all use resistors and batteries identical to the ones used in part (a).

(i)

What is current 1?

Put a **ring** around the correct value.

0.1 A

0.2 A

0.3 A

0.4 A

[1]

10

(ii)

What is current 2?

Put a **ring** around the correct value.

0.1 A

0.2 A

0.3 A

0.4 A

[1]

(iii)

What is current 3?

Put a **ring** around the correct value.

0.1 A

0.2 A

0.3 A

0.4 A

[1]

(c) Anna sets up the circuit shown using a resistor, an LDR and a battery.

She finds that when she shines a torch on the LDR the voltage across the resistor increases.

Explain why the voltage increases.

.....

.....

.....

.....

..... [3]

[Total: 8]

6 Lots of devices use an electric motor.

The diagram shows the main features of a motor.

(a) The arrow on the diagram shows the force acting on side **AB** when a current flows in the coil.

(i) Draw another arrow **on the diagram** showing the force on side **CD**. [1]

(ii) Why are there forces on sides **AB** and **CD**?

.....

.....

..... [2]

(b) Explain the function of the commutator in this motor.

.....

.....

.....

..... [3]

[Total: 6]

7 A teacher sets up a demonstration experiment. She uses a radioactive source to measure how its activity changes during a lesson.

(a) She handles the radioactive source very carefully to avoid the risk of **irradiation** and **contamination**.

Explain why contamination from the source is more hazardous than irradiation from the source.

.....

.....

.....

..... [2]

(b) The students record the activity of the radioactive source every minute.

They plotted this graph:

- (i) Complete the graph by drawing a curve of best fit to show how the source decays. [1]
- (ii) Use the graph to estimate the value for the half-life of the source.

half-life = minutes [1]

(c) Radioactive sources are considered safe when their activity becomes the same as background radiation.

- (i) What is background radiation?

.....
..... [1]

- (ii) The background radiation in the laboratory is 20 counts per minute.

After how many half-lives could this source be considered safe?

Show your working.

number of half-lives [2]

[Total: 7]

Turn over for the next question

8 The diagram represents nuclear fission that takes place in the fuel rods of a reactor at a nuclear power station.

(a) A nucleus of uranium-235 absorbs a neutron and then splits into two parts and releases a number of neutrons.

(i) How does this process produce a **chain reaction**?

.....
 [1]

(ii) How do the **control rods** in the reactor control the speed of the chain reaction?

.....
 [1]

(b) Nuclear power stations produce waste. Some of the waste is radioactive.

Some of these waste products are plutonium-238 (Pu-238) and caesium-135 (Cs-135).

Pu-238 decays to uranium (U) by emitting an alpha particle (α); Cs-135 decays to barium (Ba) by emitting a beta particle (β).

Complete these nuclear decay equations:

[3]

(c) Ali lives near the site of a proposed new nuclear power station.

He is very worried about the effects of a nuclear accident.

He knows that the risk of an accident at the power station is much less than the risk when driving his car.

Suggest why Ali is concerned, even though the risk is so low.
