

AS and A LEVEL

Delivery Guide

BIOLOGY A

H020/H420

For first teaching in 2015

Enzymes 2.1.4

Version 2

AS and A LEVEL BIOLOGY A

Delivery guides are designed to represent a body of knowledge about teaching a particular topic and contain:

- Content: A clear outline of the content covered by the delivery guide;
- Thinking Conceptually: Expert guidance on the key concepts involved, common difficulties students may have, approaches to teaching that can help students understand these concepts and how this topic links conceptually to other areas of the subject;
- Thinking Contextually: A range of suggested teaching activities using a variety of themes so that different activities can be selected which best suit particular classes, learning styles or teaching approaches.

If you have any feedback on this Delivery Guide or suggestions for other resources you would like OCR to develop, please email resources.feedback@ocr.org.uk

Would you prefer a Word version?

Did you know that you can save this pdf as a Word file using Acrobat Professional?

Simply click on **File > Export to** and select **Microsoft Word**

(If you have opened this PDF in your browser you will need to save it first. Simply right click anywhere on the page and select **Save as...** to save the PDF. Then open the PDF in Acrobat Professional.)

If you do not have access to Acrobat Professional there are a number of **free** applications available that will also convert PDF to Word (search for *pdf to word converter*).

We value your feedback

We'd like to know your view on the resources we produce. By clicking on the icon above you will help us to ensure that our resources work for you.

2.1.4 Enzymes

- | | | |
|-----|---|--|
| (a) | the role of enzymes in catalysing reactions that affect metabolism at a cellular and whole organism level | To include the idea that enzymes affect both structure and function. |
| (b) | the role of enzymes in catalysing both intracellular and extracellular reactions | To include catalase as an example of an enzyme that catalyses intracellular reactions and amylase and trypsin as examples of enzymes that catalyse extracellular reactions. |
| (c) | the mechanism of enzyme action | To include the tertiary structure, specificity, active site, lock and key hypothesis, induced-fit hypothesis, enzyme-substrate complex, enzyme-product complex, product formation and lowering of activation energy.
HSW1, HSW8 |
| (d) | (i) the effects of pH, temperature, enzyme concentration and substrate concentration on enzyme activity

(ii) practical investigations into the effects of pH, temperature, enzyme concentration and substrate concentration on enzyme activity | To include reference to the temperature coefficient (Q_{10}).
An opportunity for serial dilutions.
<i>M0.1, M0.2, M0.3, M1.1, M1.3, M1.11, M3.1, M3.2, M3.3, M3.5, M3.6</i>
PAG4
HSW1, HSW2, HSW4, HSW5, HSW6, HSW8 |
| (e) | the need for coenzymes, cofactors and prosthetic groups in some enzyme-controlled reactions | To include Cl^- as a cofactor for amylase, Zn^{2+} as a prosthetic group for carbonic anhydrase and vitamins as a source of coenzymes.
PAG4 |

- (f) the effects of inhibitors on the rate of enzyme-controlled reactions.

To include competitive and non-competitive and reversible and non-reversible inhibitors with reference to the action of metabolic poisons and some medicinal drugs, and the role of product inhibition

AND

inactive precursors in metabolic pathways (covered at A level only).
M0.1, M0.2, M0.3, M1.1, M1.3, M1.11, M3.1, M3.2, M3.3, M3.5, M3.6

PAG4

HSW1, HSW2, HSW4, HSW5, HSW6, HSW8

Enzymes are studied at GCSE. Most students beginning A Level will have an understanding of the nature of enzymes, the mechanism of enzyme action, and factors that affect the rate of enzyme-controlled reactions. Students' prior knowledge and understanding can be used as a base from which to introduce the greater depth and breadth required at A Level. The enzymes topic also provides an opportunity for students to develop some of the practical skills required by Module 1 of the specification. The topic also provides opportunities, as a part of practical or theoretical activities, to develop many of the mathematical skills listed in section 5e of the specification.

Activity 1**Biological processes 2.1.4 (a) and (b)**

To begin with students could generate a list of biological processes. This could be done from memory, of GCSE Biology or A level topics already covered, or by researching using the internet or any GCSE textbook. With guidance from the teacher, some discussion of the list could draw out the idea that the vast majority of these processes involve enzymes.

Having generated a list of processes, such as respiration, photosynthesis or digestion, students could discuss the likely location of each process, perhaps using their knowledge and understanding of specification point 2.1.1(g) cell ultrastructure. This discussion would then clarify and exemplify these specification points.

Activity 2**Enzyme action 2.1.4(c)**

Students should have studied 2.1.2(m) levels of protein structure at this point and it would be good to ensure that students have a thorough understanding of protein tertiary structure before beginning the enzymes topic.

There are many models of enzyme action available on the internet, such as

Enzyme animations (KScience)

http://www.kscience.co.uk/animations/anim_2.htm

This website shows several simple animations and allow you to adjust different variables and observe their effect.

Lock and key model vs. induced fit model (University of Surrey)

<https://www.youtube.com/watch?v=E-r3omrnxw>

This video also discusses the lock and key and induced fit models.

Students could also make and present models using, for example, modelling clay, emphasising differences between the lock and key and induced fit models. Some students could consider the limitations of representing the enzyme as the 'lock' and the substrate as the 'key'.

Activity 3**Investigating enzyme activity 2.1.4(d)**

The number of practical activities students could carry out is limited only by the time and resources available. Some options include.

Factors Affecting Enzyme Activity (Nuffield Foundation)

<http://www.nuffieldfoundation.org/practical-biology/factors-affecting-enzyme-activity>

This gives 5 experiments that could be used or adapted, for example by changing the variable being tested.

These experiments offers the opportunity for students to carry out serial dilutions.

The carrying out of any these practical activities would relate to part of the OCR Biology Practical Endorsement (PAG4) and could cover the following learning outcomes:

From Module 1: 1.1.1(a-c), 1.1.2(a-c), 1.1.3(a-d), 1.1.4(a-e), 1.2.1(b-f), 1.2.2(a-c) and (f).

From How Science Works: HSW1, HSW2, HSW4, HSW5, HSW6, HSW8.

From the list of mathematical skills: *M0.1, M0.2, M0.3, M1.1, M1.3, M1.11, M3.1, M3.2, M3.3, M3.5, M3.6.*

One of the investigations in the link above uses trypsin. This could be used as a starting point for an extension activity exploring the idea of inactive precursors of protease enzymes.

Enzyme catalysis: the serine proteases (Nature Education)

<https://www.nature.com/scitable/topicpage/enzyme-catalysis-the-serine-proteases-14398894/>

This is an open-access peer reviewed article which could be used to extend students' experience of HSW alongside their understanding of serine proteases.

Activity 4**Chloride ions, a cofactor for amylase 2.1.4(e)**

Students could investigate the effect of chloride ion concentration on the rate of starch breakdown by amylase. This would provide further opportunity to cover some of the Module 1, HSW and mathematical skill areas listed above. Class discussion could explain the results in terms of protein structure, providing a link to Biological Molecules, 2.1.2(m), (p-r).

Activity 5**Enzyme inhibition 2.1.4(f)**

Another practical activity students could carry out can be found below:

Enzyme inhibition: the effect of phosphate on phosphatase (Science and Plants for Schools)

<http://www.saps.org.uk/attachments/article/106/SAPS%20-%20Enzyme%20inhibition%20-%20the%20effect%20of%20phosphate%20on%20phosphatase%20-%20Student%20Guide.doc>

This includes full practical instructions including a student and teacher guide.

Enzyme inhibition is an ideal topic for exploring contextual examples (see below) and could again be discussed in terms of learning outcome 2.1.2(m) levels of protein structure.

Approaches to teaching the content

Students' prior knowledge and understanding can be used as an introduction to the enzymes topic as many of the concepts will have been met at GCSE. However, assessment at A Level is much higher in its expectations of language precision, use of key terms, and links to other parts of the specification. Balancing the time available between theoretical and practical approaches to delivering the topic is important. Whether taught theoretically or practically, the topic generates a number of graphs. These provide an opportunity for students to learn the meanings of the exam command words 'describe' and 'explain' by first getting students to describe a given graph, then asking them to explain why it looks like it does.

Common misconceptions or difficulties students may have

Most students are comfortable with a basic understanding of the concepts of enzyme action and the effects of inhibitors, cofactors and other variables that will affect the rate of a reaction. However, they often struggle to fully appreciate the importance of using certain key terms precisely and using them in a way that is clear and unambiguous. For example, many students will be well aware, by the end of a period of teaching, of the answer to the question "why does this reaction speed up?" A typical answer might be "because there are more collisions with the enzyme"; such a response is unlikely to gain much credit in an exam. It can take some time to get students to write "because there are more *frequent* collisions between *substrate* and the *active site*". Likewise, when discussing practical procedures many students use the term 'amount' as a go-to word of choice. This is not usually acceptable at A Level as there is always a more precise term available, such as 'concentration' or 'volume'. A useful approach to teaching these skills involves producing a set of deliberately weak answers and asking students to correct them.

Conceptual links to other areas of the specification – useful ways to approach this topic to set students up for topics later in the course

Teaching of this topic should be firmly embedded in an understanding of protein structure, 2.1.2(l-n), the practical activities are supported by 2.1.2(q-r), qualitative and quantitative tests, and the role of cofactors might have already been mentioned when covering 2.1.2(p), inorganic ions. Some appreciation of 2.1.1(g), cell ultrastructure, might also help when looking at 2.1.4(b), the intracellular and extracellular role of enzymes. If the topic is introduced by examining a range of biological processes that involve enzymes then students are likely to find it easier to make links with contextual examples met later in the course.

The concepts learnt in 2.1.4 Enzymes are relevant to the following areas of the specification:

Enzymes involved in DNA replication and transcription	2.1.3(e) and (g)
Involvement of carbonic anhydrase in the carriage of carbon dioxide in the blood	3.1.2(j)
Many organisms have enzymes that allow them to function in extreme conditions	4.2.2(g)
Natural selection of organisms with enzymes that confer, e.g. resistance to antibiotics	4.2.2(h-i)
The need for organisms to maintain a relatively constant internal temperature in order for enzymes to function effectively	5.1.1(d)
The importance of enzymes in liver function	5.1.2(b)
The role of acetylcholinesterase at a cholinergic synapse	5.1.3(d)
The role of adenylyl cyclase in 2 nd messenger systems	5.1.4(a)
Enzymes are involved in leaf loss and seed germination	5.1.5(b)
The role of enzymes and coenzymes in photosynthesis, including the effect of temperature on RuBisCO.	5.2.1(d-g)
The role of enzymes and coenzymes in respiration	5.2.2(c-i)
Control of β -galactosidase expression by the <i>lac</i> operon	6.1.1(b)
Enzymes are involved in apoptosis	6.1.1(d)
Polymerase in PCR	6.1.3(d)
The importance of restriction enzymes and ligase in genetic engineering	6.1.3(f)
Understanding why the rate of microbial growth is influenced by temperature and pH	6.2.1(e-h)
The uses of immobilised enzymes in biotechnology	6.2.1(i)

Activities

Enzymes are ubiquitous and fundamental so the range of potential contextual examples is enormous. The most useful ones are likely to fall into a few broad categories:

- enzymes that are either intracellular or extracellular,
- digestive enzymes that allow laboratory practical activity to be carried out,
- enzymes from organisms that live at extremes of temperature or pH and their possible use in industrial applications,
- enzymes that work more quickly in the presence of a cofactor,
- examples of enzymes that are inhibited by medicinal drugs or metabolic poisons.

There are many such examples and a few are listed below.

Students are likely to already be familiar with catalase. They are perhaps more familiar with extracellular digestive enzymes, such as amylase, proteases like pepsin, and lipase. These are particularly useful in practical procedures as their activity can be monitored using the common tests for biological compounds that are part of the same module (2.1.2q) (see Biology A, Module 2 Delivery Guide: Biological Molecules 2.1.2).

The list below is a selection of other interesting examples. They could be presented to students and discussed, or students themselves could research them and use their knowledge and understanding to produce a display, poster or PowerPoint presentation.

The digestive enzymes can also be considered in the context of biological washing powders, the efficacy of which is affected by temperature.

Amylase activity is increased in the presence of chloride ions and this could be considered in the context of biological washing powders.

Also, students will encounter many cofactors in the A Level topics respiration and photosynthesis but an introduction at this stage might be useful.

Learner Activity 1**Hot Spots for Cold Fish (Nature)**

<http://www.nature.com/news/1998/980917/full/news980917-7.html>

Many organisms possess enzymes that work in extremes of temperature or pH.

This Nature article is written in accessible language and discusses lactate dehydrogenase in Antarctic fish with several references to 2.1.4 learning outcomes.

Learner Activity 2**Medicines that work as enzyme inhibitors**

Many drugs are enzyme inhibitors, for example angiotensin-converting enzyme (ACE) inhibitors are used to treat hypertension. Students could research this example in depth or generate a list of other medicines that work as enzyme inhibitors, such as the antibacterial effects of penicillin or sulphonamide.

Learner Activity 3**Metabolic poisons**

Many metabolic poisons are enzyme inhibitors. Students could link ahead to other topics in this context by studying α -amanitin as an RNA polymerase inhibitor or the use of acetylcholinesterase inhibitors as insecticides or nerve gas.

Learner Activity 4**Inhibition of alcohol dehydrogenase**

The illegal addition of antifreeze to some wines in the 1980s could be used as a starting point to look at inhibition of alcohol dehydrogenase by diethylene glycol and the potential reversal of this inhibition by high concentrations of ethanol.

Students could start by searching for news articles from the time, for example,

<http://www.nytimes.com/1985/08/02/world/scandal-over-poisoned-wine-embitters-village-in-austria.html>

<https://www.thesun.co.uk/archives/health/992837/fake-booze-you-could-be-drinking-antifreeze-on-night-out/>

OCR Resources: *the small print*

OCR's resources are provided to support the delivery of OCR qualifications, but in no way constitute an endorsed teaching method that is required by OCR. Whilst every effort is made to ensure the accuracy of the content, OCR cannot be held responsible for any errors or omissions within these resources. We update our resources on a regular basis, so please check the OCR website to ensure you have the most up to date version.

This resource may be freely copied and distributed, as long as the OCR logo and this small print remain intact and OCR is acknowledged as the originator of this work.

Our documents are updated over time. Whilst every effort is made to check all documents, there may be contradictions between published support and the specification, therefore please use the information on the latest specification at all times. Where changes are made to specifications these will be indicated within the document, there will be a new version number indicated, and a summary of the changes. If you do notice a discrepancy between the specification and a resource please contact us at: resources.feedback@ocr.org.uk.

OCR acknowledges the use of the following content: N/A

Whether you already offer OCR qualifications, are new to OCR, or are considering switching from your current provider/awarding organisation, you can request more information by completing the Expression of Interest form which can be found here: www.ocr.org.uk/expression-of-interest

Please get in touch if you want to discuss the accessibility of resources we offer to support delivery of our qualifications: resources.feedback@ocr.org.uk

Looking for a resource?

There is now a quick and easy search tool to help find **free** resources for your qualification:
