4735/01 Probability & Statistics 4

QUESTION PAPER

Candidates answer on the Printed Answer Book.

OCR supplied materials:

- Printed Answer Book 4735/01
- List of Formulae (MF1)

Other materials required:

- Scientific or graphical calculator

Duration: 1 hour 30 minutes

INSTRUCTIONS TO CANDIDATES

These instructions are the same on the Printed Answer Book and the Question Paper.

- The Question Paper will be inside the Printed Answer Book.
- Write your name, centre number and candidate number in the spaces provided on the Printed Answer Book. Please write clearly and in capital letters.
- **Write your answer to each question in the space provided in the Printed Answer Book.** Additional paper may be used if necessary but you must clearly show your candidate number, centre number and question number(s).
- Use black ink. HB pencil may be used for graphs and diagrams only.
- Answer **all** the questions.
- Read each question carefully. Make sure you know what you have to do before starting your answer.
- Do **not** write in the bar codes.
- You are permitted to use a scientific or graphical calculator in this paper.
- Give non-exact numerical answers correct to 3 significant figures unless a different degree of accuracy is specified in the question or is clearly appropriate.

INFORMATION FOR CANDIDATES

This information is the same on the Printed Answer Book and the Question Paper.

- The number of marks is given in brackets [] at the end of each question or part question on the Question Paper.
- **You are reminded of the need for clear presentation in your answers.**
- The total number of marks for this paper is **72**.
- The Printed Answer Book consists of **12** pages. The Question Paper consists of **4** pages. Any blank pages are indicated.

INSTRUCTION TO EXAMS OFFICER/INVIGILATOR

- Do not send this Question Paper for marking; it should be retained in the centre or recycled. Please contact OCR Copyright should you wish to re-use this document.

1 For the events A and B it is given that

$$P(A) = 0.6, P(B) = 0.3 \text{ and } P(A \text{ or } B \text{ but not both}) = 0.4.$$

(i) Find $P(A \cap B)$. [3]

(ii) Find $P(A' \cap B)$. [1]

(iii) State, giving a reason, whether A and B are independent. [1]

2 The manufacturer of a painkiller, designed to relieve headaches, claims that people taking the painkiller feel relief in at most 30 minutes, on average. A random sample of eight users of the painkiller recorded the times it took for them to feel relief from their headaches. These times, in minutes, were as follows:

33 39 29 35 40 32 26 37

Use a Wilcoxon single-sample signed-rank test at the 5% significance level to test the manufacturer's claim, stating a necessary assumption. [8]

3 The manufacturer of electronic components uses the following process to test the proportion of defective items produced.

A random sample of 20 is taken from a large batch of components.

- If no defective item is found, the batch is accepted.
- If two or more defective items are found, the batch is rejected.
- If one defective item is found, a second random sample of 20 is taken. If two or more defective items are found in this second sample, the batch is rejected, otherwise the batch is accepted.

The proportion of defective items in the batch is denoted by p , and $q = 1 - p$.

(i) Show that the probability that a batch is accepted is $q^{20} + 20pq^{38}(q + 20p)$. [3]

For a particular component, $p = 0.01$.

(ii) Given that a batch is accepted, find the probability that it is accepted as a result of the first sample. [3]

4 The discrete random variable Y has probability generating function

$$G_Y(t) = 0.09t^2 + 0.24t^3 + 0.34t^4 + 0.24t^5 + 0.09t^6.$$

(i) Find the mean and variance of Y . [5]

Y is the sum of two independent observations of a random variable X .

(ii) Find the probability generating function of X , expressing your answer as a cubic polynomial in t . [3]

(iii) Write down the value of $P(X = 2)$. [1]

- 5 The random variable X has a Poisson distribution with mean λ . It is given that the moment generating function of X is $e^{\lambda(e^t-1)}$.
- (i) Use the moment generating function to verify that the mean of X is λ , and to show that the variance of X is also λ . [7]
- (ii) Five independent observations of X are added to produce a new variable Y . Find the moment generating function of Y , simplifying your answer. [2]
- 6 In a two-tail Wilcoxon rank-sum test, the sample sizes are 13 and 15. The sum of the ranks for the sample of size 13 is 135. Carry out the test at the 5% level of significance. [9]
- 7 The discrete random variable X can take the values 0, 1 and 2 with equal probabilities. The random variables X_1 and X_2 are independent observations of X , and the random variables Y and Z are defined as follows:
- Y is the smaller of X_1 and X_2 , or their common value if they are equal; $Z = |X_1 - X_2|$.
- (i) Draw up a table giving the joint distribution of Y and Z . [5]
- (ii) Find $P(Y = 0 | Z = 0)$. [2]
- (iii) Find $\text{Cov}(Y, Z)$. [7]
- 8 The independent random variables X_1 and X_2 have the distributions $B(n_1, \theta)$ and $B(n_2, \theta)$ respectively. Two possible estimators for θ are
- $$T_1 = \frac{1}{2} \left(\frac{X_1}{n_1} + \frac{X_2}{n_2} \right) \text{ and } T_2 = \frac{X_1 + X_2}{n_1 + n_2}.$$
- (i) Show that T_1 and T_2 are both unbiased estimators, and calculate their variances. [8]
- (ii) Find $\frac{\text{Var}(T_1)}{\text{Var}(T_2)}$. Given that $n_1 \neq n_2$, use the inequality $(n_1 - n_2)^2 > 0$ to find which of T_1 and T_2 is the more efficient estimator. [4]

END OF QUESTION PAPER

**Copyright Information**

OCR is committed to seeking permission to reproduce all third-party content that it uses in its assessment materials. OCR has attempted to identify and contact all copyright holders whose work is used in this paper. To avoid the issue of disclosure of answer-related information to candidates, all copyright acknowledgements are reproduced in the OCR Copyright Acknowledgements Booklet.
